1 HOMEWORK 3

1.0.1 Q1. Understanding DETR model

• Fill-in-the-blank exercise to test your understanding of critical parts of the DETR model workflow.

```
[17]: from torch import nn
      class DETR(nn.Module):
          def __init__(self, num_classes, hidden_dim=256, nheads=8,
                       num_encoder_layers=6, num_decoder_layers=6, num_queries=100):
              super(). init ()
              # create ResNet-50 backbone
              self.backbone = resnet50()
              del self.backbone.fc
              # create conversion layer
              self.conv = nn.Conv2d(2048, hidden_dim, 1)
              # create a default PyTorch transformer
              self.transformer = nn.Transformer(
                  hidden_dim, nheads, num_encoder_layers, num_decoder_layers)
              # prediction heads, one extra class for predicting non-empty slots
              # note that in baseline DETR linear_bbox layer is 3-layer MLP
              self.linear class = nn.Linear(hidden dim, num classes + 1)
              self.linear_bbox = nn.Linear(hidden_dim, 4)
              # output positional encodings (object queries)
              self.query_pos = nn.Parameter(torch.rand(num_queries, hidden_dim))
              # spatial positional encodings
              # note that in baseline DETR we use sine positional encodings
              self.row_embed = nn.Parameter(torch.rand(50, hidden_dim // 2))
              self.col_embed = nn.Parameter(torch.rand(50, hidden_dim // 2))
          def forward(self, inputs):
```

```
# propagate inputs through ResNet-50 up to aug-pool layer
x = self.backbone.conv1(inputs)
x = self.backbone.bn1(x)
x = self.backbone.relu(x)
x = self.backbone.maxpool(x)
x = self.backbone.layer1(x)
x = self.backbone.layer2(x)
x = self.backbone.layer3(x)
x = self.backbone.layer4(x)
# convert from 2048 to 256 feature planes for the transformer
h = self.conv(x)
# construct positional encodings
H, W = h.shape[-2:]
pos = torch.cat([
    self.col_embed[:W].unsqueeze(0).repeat(H, 1, 1),
    self.row_embed[:H].unsqueeze(1).repeat(1, W, 1),
], dim=-1).flatten(0, 1).unsqueeze(1)
# propagate through the transformer
h = self.transformer(pos + 0.1 * h.flatten(2).permute(2, 0, 1),
                     self.query pos.unsqueeze(1)).transpose(0, 1)
# finally project transformer outputs to class labels and bounding boxes
pred_logits = self.linear_class(h)
pred_boxes = self.linear_bbox(h)
return {'pred_logits': pred_logits,
        'pred_boxes': pred_boxes}
```

1.0.2 Q2. Custom Image Detection and Attention Visualization

In this task, you will upload an **image of your choice** (different from the provided sample) and follow the steps below:

- Object Detection using DETR
- Use the DETR model to detect objects in your uploaded image.
- Attention Visualization in Encoder
- Visualize the regions of the image where the encoder focuses the most.
- Decoder Query Attention in Decoder
- Visualize how the decoder's query attends to specific areas corresponding to the detected objects.

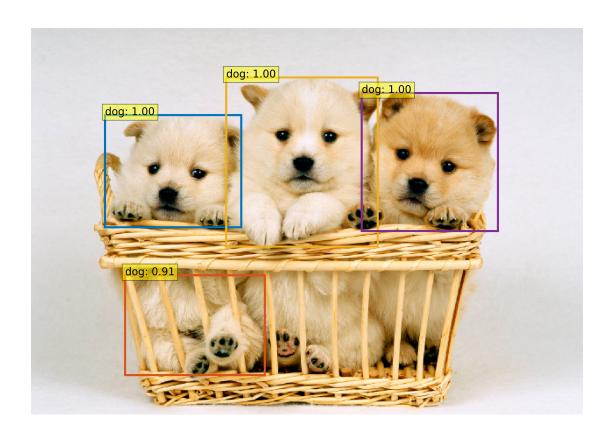

```
[18]: import math
      from PIL import Image
      import requests
      import matplotlib.pyplot as plt
      %config InlineBackend.figure_format = 'retina'
      import ipywidgets as widgets
      from IPython.display import display, clear_output
      import torch
      from torch import nn
      from torchvision.models import resnet50
      import torchvision.transforms as T
      torch.set_grad_enabled(False);
      # COCO classes
      CLASSES = \Gamma

```

In this section, we show-case how to load a model from hub, run it on a custom image, and print the result. Here we load the simplest model (DETR-R50) for fast inference. You can swap it with any other model from the model zoo.

```
# convert boxes from [0; 1] to image scales
bboxes_scaled = rescale_bboxes(outputs['pred_boxes'][0, keep], im.size)
# mean-std normalize the input image (batch-size: 1)
img = transform(im).unsqueeze(0)
# propagate through the model
outputs = model(img)
# keep only predictions with 0.7+ confidence
probas = outputs['pred_logits'].softmax(-1)[0, :, :-1]
keep = probas.max(-1).values > 0.9
# convert boxes from [0; 1] to image scales
bboxes_scaled = rescale_bboxes(outputs['pred_boxes'][0, keep], im.size)
# mean-std normalize the input image (batch-size: 1)
img = transform(im).unsqueeze(0)
# propagate through the model
outputs = model(img)
# keep only predictions with 0.7+ confidence
probas = outputs['pred_logits'].softmax(-1)[0, :, :-1]
keep = probas.max(-1).values > 0.9
# convert boxes from [0; 1] to image scales
bboxes_scaled = rescale_bboxes(outputs['pred_boxes'][0, keep], im.size)
plot_results(im, probas[keep], bboxes_scaled)
```

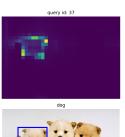

Using cache found in C:\Users\PYC/.cache\torch\hub\facebookresearch_detr_main

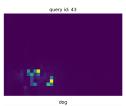

```

color='r'))

         fcenter_ax.axis('off')
```

1.0.3 Q3. Understanding Attention Mechanisms

In this task, you focus on understanding the attention mechanisms present in the encoder and decoder of DETR.

- Briefly describe the types of attention used in the encoder and decoder, and explain the key differences between them.
- Based on the visualized results from Q2, provide an analysis of the distinct characteristics of each attention mechanism in the encoder and decoder. Feel free to express your insights.

1.0.4 Key Differences Between Encoder and Decoder Attention

Attention Focus:

The encoder's self-attention focuses on the input image, aiming to generate contextual features for each pixel or region. The decoder's cross-attention focuses on the encoder's output features, aligning these features with the decoder's query vectors to generate final detection predictions.

Information Flow:

The encoder only processes the input image features, establishing relationships between parts of the image using self-attention. The decoder processes the encoded features from the encoder, and through cross-attention, it refines these features to predict bounding boxes and labels.

Encoder Self-Attention

Focus on Key Features: The encoder's self-attention mechanism shows strong focus on critical regions of the image, such as the head of a person or the body of an animal. Global Information: The self-attention in the encoder allows the model to capture spatial relationships between objects in the image. For example, in a multi-object scene, the encoder learns how objects relate to each other (e.g., a person walking next to a vehicle). Fusion of Local and Global Context: In more complex scenes, the encoder captures both local features (e.g., edges of objects) and global features (e.g., the overall spatial layout of objects), improving the model's understanding of the entire scene.

Decoder Cross-Attention

Target Alignment: The decoder's cross-attention mechanism focuses on encoded feature maps and selectively attends to regions related to the detected objects. For instance, the attention may focus strongly on the bounding box of a detected person or vehicle while attending less to background regions. Alignment of Queries with Features: By attending to the encoder's output features, the decoder refines the predictions for bounding boxes and object categories. This is evident in the visualizations, where the decoder's attention is tightly aligned with the detected objects. Specific Object Emphasis: The decoder highlights specific objects more than others. For instance, if a car is detected, the decoder's attention may be more focused on the car's wheels or body, rather than irrelevant parts of the image.
